

To Whom It May Concern:

It is increasingly important to allow additional license free spectrum for effective fostering of broadband deployment in not only rural areas but metro areas as well.

Current development and use of existing spectrum has shown that this technology is a viable means of transport of broadband services to consumers. Additional spectrum in the 3.x Ghz range would prove both beneficial to the general public as according to the proposal would allow up to 25Watts to be used. Thus, increasing range and decreasing deployment costs. Increased power levels and antenna gains could allow truly mobile access.

We as an WISP appreciate the FCC's Bold and exciting new move for more spectrum allocation. We encourage the FCC to allow the spectrum to be used for WISP use.

We do not encourage the use of this spectrum to be used for general consumer goods to be used in the home. Including Residential wireless access points, Cordless phones, etc.

Sincerely,

Kent Andersen
